Sustainable and Climate-friendly Palm Oil Production and Procurement (SCPOPP) in Thailand

Currently, locally-produced sustainable palm oil is limited, accounting only 2% of the total palm oil production in Thailand. This is because of large number of oil palm smallholder farmers lack group unity, access to micro-finance and capacity and knowledge.

Background

Our Project

Around 22% of Thailand's entire greenhouse gas emissions come from the agricultural sector. In the oil palm plantation, changing fertilizer use and recycling organic materials hold strong potential for reducing the emission in the palm oil sector.

The project closely works with public and private partners to promote international sustainability standards for palm oil production and support smallholder farmers in achieving sustainable palm oil certification. The project also offers an access to the sustainability markets for the smallholder farmers who join the training.

Our Impact

At least 3,000 famers gain Knowledge and skills

At least 10 private sectors join the project

Reduce 9,600 Tons of CO₂ eq of greenhouse gas emission

In 2022 We will achieve

Reduce investment cost almost 20%

Train the trainers at least 50 trainers
